Start

OUR FIRST IDEA IS: SAFEPARK

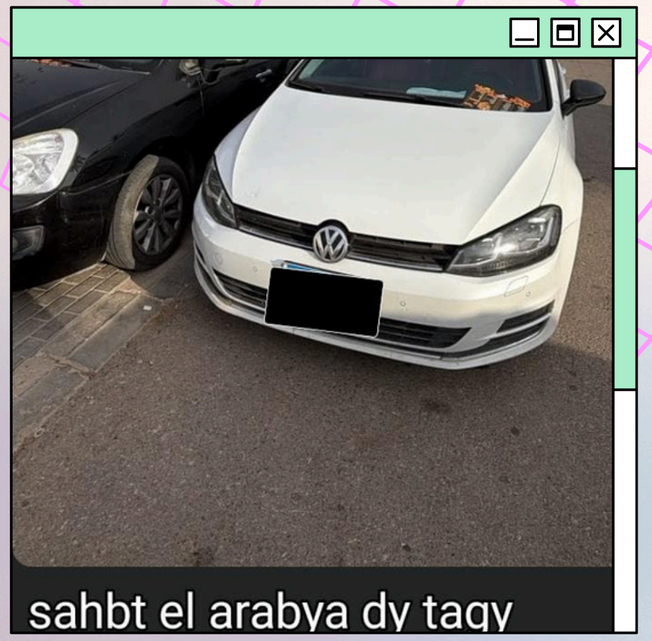

THE BEGINNING OF EVERYTHING

Everything started when we noticed people constantly sending messages in the university group chats, asking whoever had blocked their car to move it. Sometimes, these messages would get lost among other texts, leaving people waiting and frustrated. So we came up with the idea of safepark. By scanning a QR code on a car, anyone can quickly notify its owner about an issue with no phone calls, no searching through university group chats. All you have to do is scan the QR code and the car owner will get a notification

THE PROBLEM

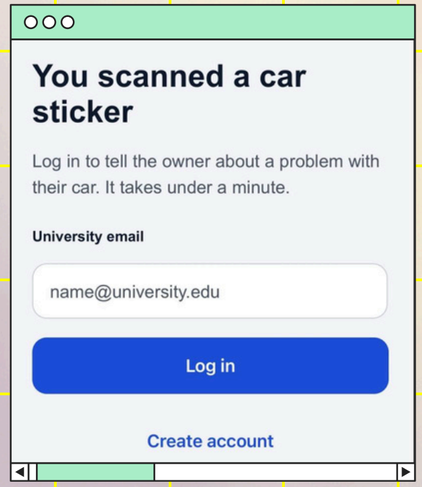

We noticed that our university group chats are constantly filled with messages asking car owners to move their cars because they're blocking others, or reminding someone that they've accidentally left their headlights on.

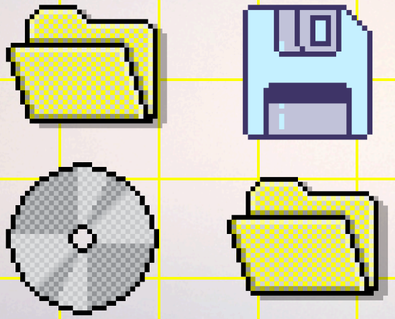

OUR SOLUTION

The QR code sticker on the car when scanned, the QR code opens a web page where users can upload a photo and describe the issue such as left-on headlights or a blocked car. To ensure safety and prevent abuse, users must log in with an account, and an automated content filter strictly blocks spam, and inappropriate messages, This allows drivers in lectures or meetings to receive instant, secure notifications without taking a phone call,Every 15 minutes, someone in the university group asks, 'Whose car is this?' or reports a blocked car or hazard lights left on.

CATEGORIZING SAFEPARK FEATURES

https://acrobat.adobe.com/id/urn:aaid:sc:AP:968e8839-8b4a-42f1-8e0f-3351598664e0

MUST HAVE FEATURES:

1- User Authentication & Profiles:
Users can create accounts and log in securely. Car owners can register their vehicles and link each vehicle to a unique QR code, while other users can report issues through the system.

2- Direct Owner Notifications:
Whenever someone reports a problem, the car owner receives an instant notification, allowing them to respond quickly without having to check group chats or receive a phone call.

SHOULD HAVE FEATURES:

Privacy-Protected Communication:
Built-in messaging and quick replies allow users to communicate about parking issues without revealing their personal phone numbers, protecting their privacy.

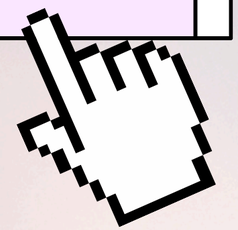

COULD HAVE FEATURES:

Multi-Vehicle Management:
Users can register and manage multiple vehicles under one account, with a unique QR code for each vehicle, making SafePark more convenient for families or people who own multiple cars.

HELP IS ALWAYS ONE TAP AWAY

Our most important feature is:

Roadside Assistance:
Provides drivers with quick and reliable support during unexpected roadside emergencies. The app offers one-tap access to emergency numbers, helps users locate nearby gas stations when they run out of fuel, provides an AI-powered assistant to guide them through car troubles, and displays nearby mechanics and their locations when professional assistance is needed.

OUR SECOND IDEA IS: STUDENTGRO

THE BEGINNING OF EVERYTHING

StudentGro is a personalised planner designed to help university students overcome poor organisation and time management. It organises daily, weekly, and monthly schedules, allowing students to categorise their academic and personal tasks in one place. By creating organised schedules based on their tasks and available time, StudentGro helps students manage their workload more easily and balance their studies with everyday life.

WHAT MAKES OUR APP SPECIAL?

StudentGro brings everything students need into one app, eliminating the need to switch between multiple applications. It includes a study timer and break timer to help students stay focused while maintaining a healthy study routine. The built-in calendar keeps their schedules organised, while AI prioritises important tasks and helps students manage their workload. Students can also set reminders for upcoming project deadlines, assignments, and quizzes. Additionally, the app includes personal reminders for students who struggle to remember to take their medication or drink enough water, along with an AI assistant (Eagle) to provide helpful guidance and support whenever they need it.

Our AI assistant

THE CASE STUDIES

After reading the following case study:

First Case study:

https://ijsrem.com/download/prepwisea-smart-ai-driven-study-planner-for-improving-student-productivity

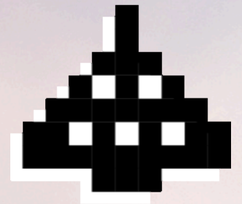

which presents a concept similar to our app, it inspired us to organise and consider a range of features which would lead to navigating, and using the app being much more convenient.

Second Case study :

https://su-plus.strathmore.edu/items/c3d50f1b-9ac7-4200-87e2-d7dfd388f2d9

The challenges students face in managing their time is illustrated by the study, demonstrated by research. It goes onto proving positive results from their similar app idea, reporting how there was a 25% improvement in time management and a 33% increase in academic performance. This proves that the creation of StudentGro would most likely achieve similar results.

CATEGORIZING STUDENTGRO FEATURES:

https://acrobat.adobe.com/id/urn:aaid:sc:AP:d49f3b35-4931-4513-8182-17c0046404c2

MUST HAVE FEATURES:

1- Secure Login & Authentication: Protects users' personal information and saved schedules through a secure account system.
2- Daily Organiser: Creates a personalised daily schedule based on the student's tasks, priorities, and available time.
3- Calendar: Allows students to view, organise, and keep track of upcoming tasks, assignments, quizzes, and deadlines.

SHOULD HAVE FEATURES:

1- User-Friendly Interface: Provides a simple, intuitive design that makes navigating the app easy and enjoyable.
2- Smart Reminders: Sends timely notifications about upcoming deadlines and important tasks, helping students stay organised and avoid missing commitments.

COULD HAVE FEATURES:

1- Study & Break Timer: Helps students structure their study sessions and breaks to maintain focus and develop effective study habits.
2- Motivational Quotes: Displays encouraging messages to help students stay positive and motivated throughout their academic journey.
3- Interactive Mascot: Adds a friendly personality to the app, making the planning experience more engaging and enjoyable.

SUCCESS CRITERIA FOR EACH APP

StudentGro

success criteria:
Effective organisation: At least 8-10 students should be able to create daily, weekly, and monthly schedules and categorise tasks easily.
Deadline management: The app should successfully send deadline reminders to users 95% of the time.
User-friendly interface: At least 8-10 students should be able to navigate the app without assistance.

SafePark:

Success criteria:
Significant Drop in Public Parking Complaints.(80%)
1- High Resolution Speed & Direct Engagement.(70%)
2- Safety, Spam Prevention, & System Reliability.(90%)

SUCCESS CRITERIA AND EXPECTED OUTCOMES

COMPARISON

SafePark:

Strengths:

1- Our team is good with using Flutter

2- resolves the campus parking issue and provides user privacy via masked messaging.

Weaknesses:

1- It is our first time doing a project.

2- physical QR codes can be damaged, and the automated filters can result in false positives or fail to catch subtle forms of harassment.

Opportunities: can be expanded into parking space tracking and is very well aligned with data privacy regulations.

Threats: drivers with phones on silent or who do not check notifications during lectures might still delay moving their vehicles.

Safepark Vs StudentGro

StudentGro:

Strengths:

1- Our team is good with using Flutter

2- the daily schedule generation all in one place, the task categorisation and study habits, the study timers and the break reminders.

Weaknesses:

1- It is our first time doing a project.

2- the sheer amount of competition.

Opportunities: integration with Moodle to automatically generate assignment deadlines and in terms of group study planning.

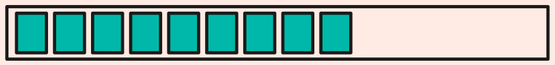

Threats: dependence on the student to manually enter their own tasks and schedules.

CRITERION	WEIGHT	SAFEPARK	STUDENTGRO
User need	40%	4	3.5
Feasibility	15%	3	4
Gap left	25%	4.5	2.7
Mobile fit	20%	3.5	4
Weighted total	100%	3.88	3.48
Winner		SAFEPARK	

Final reflection

OUR CHOSEN APP IDEA IS..... SAFEPARK!!!!!
